Background

- Two CEC-funded studies that involve remote sensing to improve wind forecasts in the TWRA
- Objective: Provide a robust set of meteorological data for
 - Characterizing the meteorological processes that influence lower boundary-layer winds
 - Improving short-term wind forecasts
 - Guidance for forecast NWP model improvements
 - Additional real-time input data for NWP models
 - Additional real-time input data for statistical
 - Determining “best” network
- Continued operations are funded by EPRI to help transition research to operations and expand measurements to SWRA

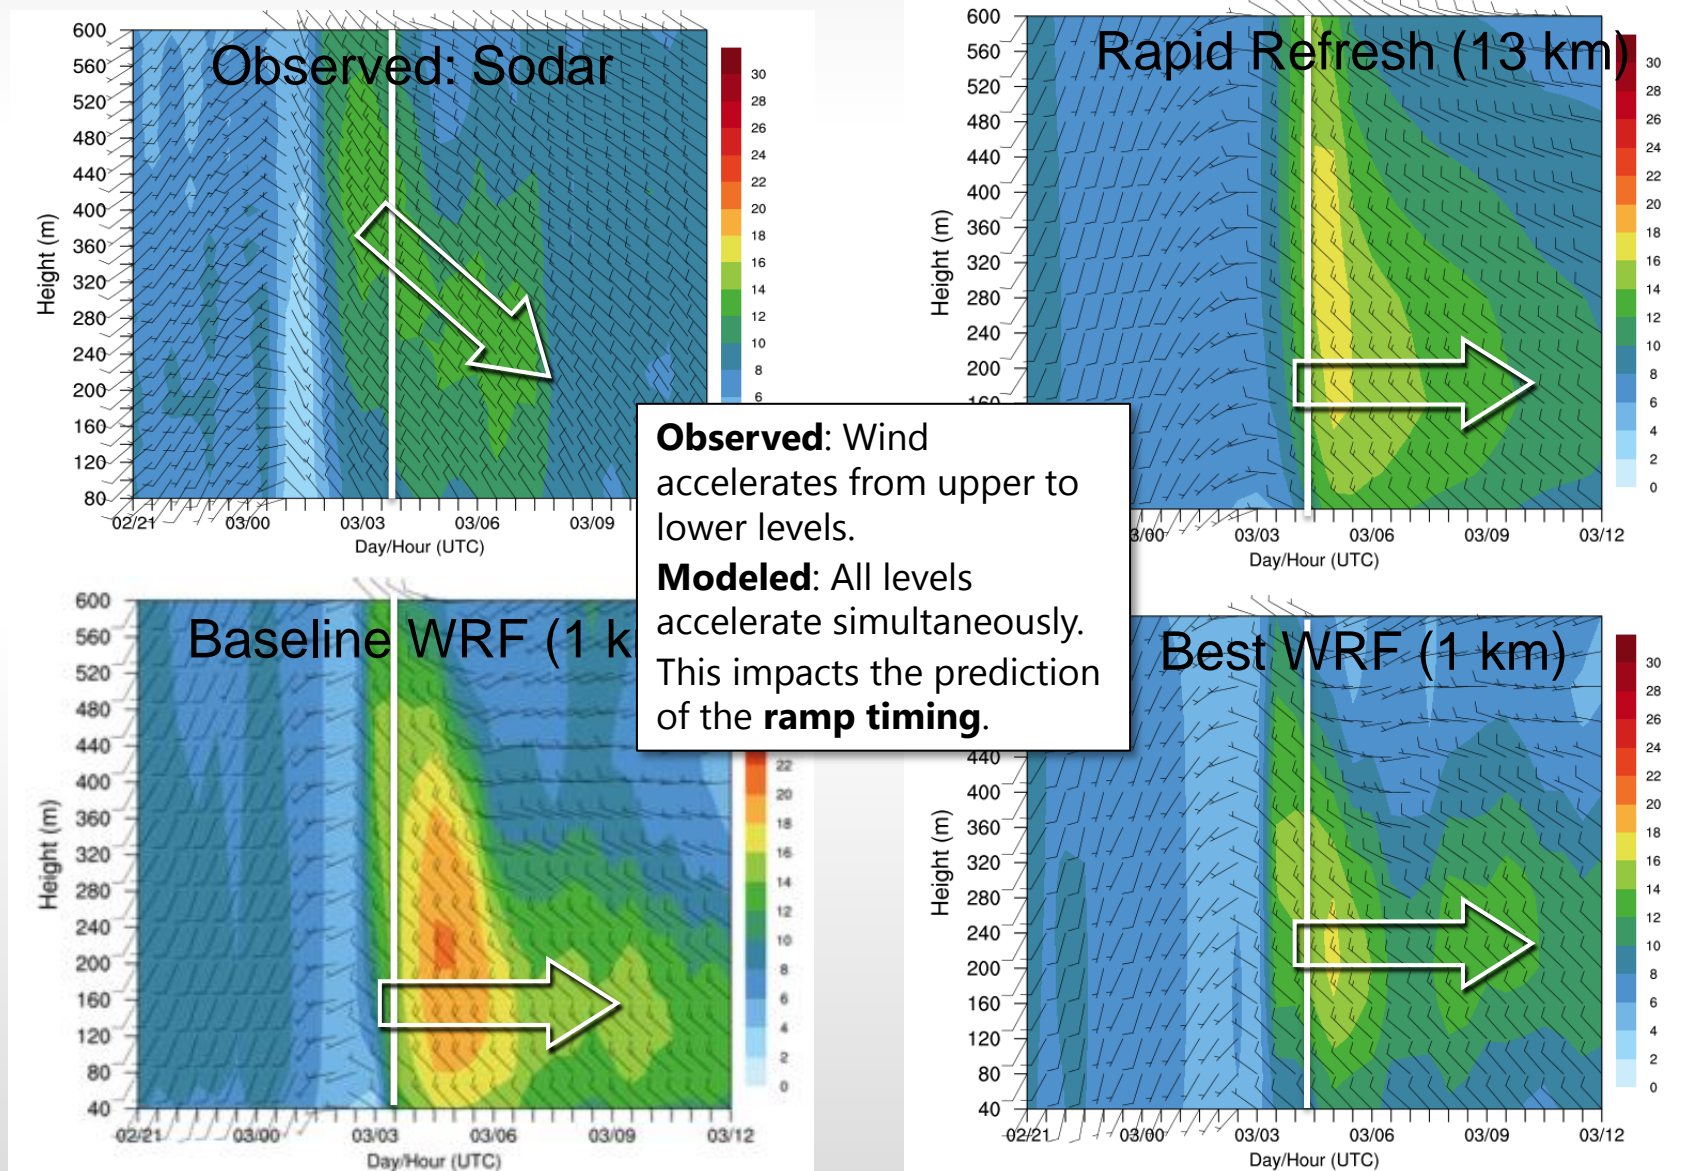

Research Network

Example of Data Use: Impact of NWP Configuration on Vertical Structure

May 2-3, 2015 Event (1108 MW/60 mins) – Avalon Sodar Site

Example Data Use: Preliminary Aggregated Performance, August 2016

0-2.5 hour best performance with project data assimilation (yellow line)

MAE Skill Score: EBOFS vs BOFS
